

## Data Migration and Transformation from Azure SQL to Azure Data Lake and Databricks

1. Created a table in Azure SQL and added car data to it. Used the Copy Data pipeline of Azure Data Factory to transfer the data into Azure Data Lake.

2. Imported the data from Azure Data Lake into Databricks using PySpark. Performed some transformations using PySpark.

3. Transferred the final transformed data back into Azure Data Lake using an Azure Data Factory pipeline (integrated the entire process using the Data Factory pipeline).
